

AI38 ABSORPTION PADS FEEDER

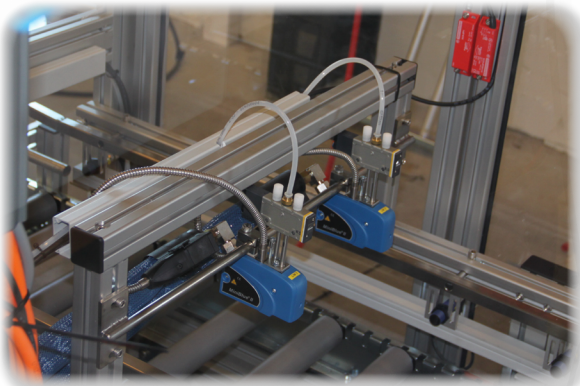

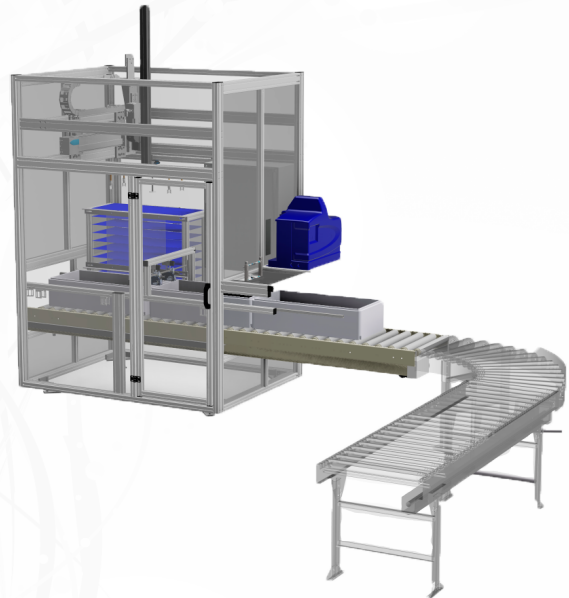

DESIGN

The machine is designed for the placement of absorption pads in fishboxes

The machine is usually positioned before a stacking/taping machine.

A cassette of pads is placed in the machine. The machine automatically starts, when a box is in position.

Boxes are automatically feed to the machine via conveyors.

The customer at the center of attention

The pad placement machine is designed according to customer specifications, and is adaptable to most box sizes.

At CK Teknik we draw and possibly animate all products in 3D, which will cause unforeseen mechanical problems already to be identified and corrected in the design phase.

Options

The machine can by request be delivered with an automated glue system.

Glue is sprayed from 2 nozzles to the bottom of the boxes. This will keep the pads in place.
